Material Handling Engineering Bulletin

Shaft Safety Covers for Conveyors and Elevators.

A few grain elevators and larger companies have been asking for a higher level of shaft guarding. This level of guarding is mostly seen in the mining industry, but due to the special requests we have come up with a design to fit our conveyors and elevators. These covers protect workers from open spinning shafts while allowing them to still grease bearings or easily remove covers to replace components. The covers are available on conveyors and elevators and are split into kits to cover different components. These covers are made and engineered on an order to order basis with an additional lead time of 2 weeks for engineering to create the covers design for the specific component.
